

Activity — Read the Working Instrument

60 minutes · in pairs · open notebooks · **every answer cites a section number.** *“It says somewhere” is not a citation.*

Names: Sanchez, Eliah Therrien Estrella **Team:** 1 — Alcantara · Sanchez / 2 — Lagdamen · Lopez

TEAM 1 — Alcantara · Sanchez

Notebook 02 — The Credential and the Job, Rev. 2. Your names are on its header.

TEAM 2 — Lagdamen · Lopez

Notebook 01 — Assessment Hubs and Assessment Deserts. Your names are on its header.

PART A · EVERYONE TOGETHER 10 MINUTES

The extraction notebook (02) — where does the human judgment live?

A1. Notebook 02 runs on one rule that splits the work between the script and the human. Write the rule, and name the FILE where the human’s column judgment is recorded.

- The rule is to resolve each variable using the aliases against the file’s real header instead of guessing the column name. The human’s column judgement is recorded in docs/decision_log.md shown in Part D number 20.

A2. The harvester pulls every number as n1, n2, n3 ... instead of naming them “graduates” or “assessed.” Why? One sentence.

- I could not find anything in the notebook about n1, n2, n3.

A3. flag_anomalies marks a suspicious row. What does it deliberately NOT do to that row — and what is the sentence the notebook gives as the reason?

- I did not see such thing as flag_anomalies in the notebook.

PART B · YOUR OWN NOTEBOOK 30 MINUTES

Hunt the three disciplines — with cell-level evidence

Answer the six items for YOUR team’s notebook only. Evidence means a section number plus a quoted sentence or a printed number.

TEAM 1 — Notebook 02 (skip if you are Team 2)

B1. FEATURES — §8 contains a one-question test that decides every feature. Copy it verbatim.

B2. FEATURES — Name the two feature sets. For which outcome is the job-context set circular, and why?

- The two feature sets are Person profile and Job context. Job context is circular for Outcome 1, because it describes the job the person already has and would encode the answer.

B3. FEATURES — One feature is banned from Outcome 2 in writing. Which one, what did the Rev. 1 SHAP plot show, and what is the label’s definition that makes it a leak?

- The banned feature is hours_worked. The Rev. 1 SHAP plot showed that “hours dwarfed everything.” It is a leak because Outcome 2 is defined using hours under 40 plus wanting more hours, so giving the model hours would basically give it part of the answer.

B4. BASELINES — §9 fits four models on the same features and weights. List them in order. What must LightGBM beat to earn its place — and if it fails, what does the notebook say the paper reports?

The four models are:

1. Majority-class rate
2. L2 logistic regression
3. Depth-3 tree
4. LightGBM

LightGBM must beat the logistic baseline on the test rounds. If it does not, the notebook says the result should be reported as not usefully predictable from a survey profile.

B5. PIPELINE — Calibration is fitted on one block and the reliability diagram is drawn on another. Which blocks? And how many times is the test block touched per model, and for what?

- Calibration is fitted on the validation block, while the reliability diagram uses the test block. The test block is touched once per model, only for the final metrics, and not for tuning.

B6. PIPELINE — Write the temporal split (§7) in numbers. Why does the calendar do the splitting, not a random draw?

- The split is 23 train / 8 validate / 8 test. It uses a calendar-based split because the notebook uses a temporal split, not a random one. The notebook also lists the validation as “train 23 / validate 8 / test 8.”

TEAM 2 — Notebook 01 (skip if you are Team 1)

B1. PIPELINE — The header names the full path a reviewer must be able to walk, from source table to claim. Copy the chain, arrows and all.

B2. BASELINES — §11 names two baselines. What are they, and WHY are they fitted before any model rather than after?

B3. PIPELINE — §12 explains why a random 80/20 split on this panel would be worthless. Write the reason in one sentence (yours or the notebook’s).

B4. BASELINES — What does MASE below 1.0 mean in plain words? And why does the notebook refuse MAPE for regional volumes?

B5. REGISTERS — Which of the five registers does a baseline forecast belong to? From §11, copy one “You may write” sentence and one “You may not write” sentence.

B6. PIPELINE — The window guard in §6: which years may PANEL_COV never contain, and how often is that assertion checked?

PART C · CROSS-BRIEF 15 MINUTES

Teach the other team one discipline

Pick ONE discipline you found (features, pipeline, or baselines). Teach it to the other team in two minutes: evidence first — section number, quoted sentence or printed number — then the lesson in one sentence.

C1. The discipline WE taught, and the evidence we used:

C2. The discipline WE WERE taught, and one specific place it will apply in OUR OWN track project (P4–P7):

Hand in: this sheet, both names on it, before wrap-up. Carry answer C2 into your next milestone — I will look for it there.
